

New Technologies in Sound

Fairmont Designs and LeapSonic have partnered to bring the newest technology in hidden vibration speaker sound to the bath industry.

Utilizing advancements in Bluetooth capabilities, Fairmont Designs and LeapSonic enhance the bathroom audio experience by allowing homeowners to use any music source (iPod, smart phone, MP3 or CD player) to create a personal ambiance reflective of the moment.

LeapSonic Audio-Actuators can easily be installed inside your vanity; along the side or in a drawer concealing the hardware for a clean appearance, while maintaining the surround sound experience.

Originally developed by the US Navy for sonar applications, the technology is now available for commercial applications. By simply attaching the drive to a resonant material like glass, wood or metal and both sides of the surface are transformed into a high quality, wide bandwidth, and invisible speaker emitting sound evenly across its surface area.
